

Write a short explanation (3-4 lines) of how using Firebase as a backend service benefits front-end developers building apps like Instagram or Zomato.

Ans:

Firebase provides ready-to-use backend services such as Authentication, Firestore Database, Storage, and Hosting, allowing front-end developers to build full-stack applications without creating their own server. For apps like Instagram or Zomato, Firebase makes it easy to manage user accounts, store posts or restaurant data, upload images, and receive real-time updates. This speeds up development and lets developers focus more on building the user interface and user experience.
